

# All My Work

Your saved learning record for Human Development.

---

1 completed activity run. Required checks and formative practice are recorded separately.

Unfinished work: 0 required check(s), 1 practice run(s). Resume them from their original sections; they are not counted as completed.

Writing and flash-card self-assessments are not automatically graded. Completion is not a mastery certificate.

---

## Mixed practice

9/17/2026, 8:42:05 PM • Elapsed 0m 1s • Formative practice

### Review submitted responses and attempts

First-try result: 7/7. Later corrections are recorded separately.

**Name the term described: An anterior-pituitary hormone that stimulates milk production.**

Attempt 1: prolactin — Correct.

Reference: prolactin

**Explain fertilization.**

Self-report: Study again.

Reference: The joining of sperm and egg contributions to form a zygote.

### **What does letter C identify?**

Options shown: Blastocyst cavity · Inner cell mass · Morula · Trophoblast · Zygote

Attempt 1: Blastocyst cavity — Correct.

Reference: Blastocyst cavity

### **Which term matches this description? A response that reinforces the initiating change.**

Options shown: positive feedback · oxytocin · cervical dilation · parturition

Attempt 1: positive feedback — Correct.

Reference: positive feedback

### **Put these steps in order: hCG and maintaining early pregnancy**

Options shown: Trophoblast-derived tissue releases hCG · Corpus luteum continues progesterone and estrogen secretion · Endometrial support continues · hCG maintains the corpus luteum

Attempt 1: Trophoblast-derived tissue releases hCG → hCG maintains the corpus luteum → Corpus luteum continues progesterone and estrogen secretion → Endometrial support continues — Correct.

Reference: Trophoblast-derived tissue releases hCG → hCG maintains the corpus luteum → Corpus luteum continues progesterone and estrogen secretion → Endometrial support continues

### **Select the TWO accurate statements about gastrulation and the three germ layers.**

Options shown: The entire intestine, including all its muscle, comes only from endoderm. · Ectoderm forms only skin and never nervous tissue. · Whole organs often contain tissues from more than one germ layer. · Gastrulation changes organization; it is not simply another name for cleavage.

Attempt 1: true-2 → true-1 — Correct.

Reference: Whole organs often contain tissues from more than one germ layer. ·  
Gastrulation changes organization; it is not simply another name for cleavage.

**Which term fits this definition? Widening of the cervix during labour.**

Self-report: Study again.

Reference: cervical dilation

**Correct this incorrect statement: Oxytocin is made by the placenta to manufacture milk.**

Self-report: Study again.

Reference: A hormone made in the hypothalamus and released by the posterior pituitary that supports uterine contractions and milk ejection. Its role in milk ejection differs from prolactin's role in milk production.

**Identify the term illustrated: Mammary tissue provides milk after birth.**

Attempt 1: lactation — Correct.

Reference: lactation

**A model embryo has the usual cell number but an abnormal arrangement of tissues. Which developmental process is most directly implicated?**

Options shown: Morphogenesis · Milk ejection · An increase in haploid chromosome sets · Gamete transport

Attempt 1: Morphogenesis — Correct.

Reference: Morphogenesis

---

## Collected optional responses

---

### Stem cells and development

The comparison alone cannot isolate the proposed chemical effect. Hormone production and receptor response are distinct steps.

---

## Textbook question work

Draft and saved question responses. Optional and ungraded.

No textbook question work yet.

---

## Supported and independent practice
