

All My Work

Your saved learning record for Cellular Reproduction.

1 completed activity run. Required checks and formative practice are recorded separately.

Unfinished work: 0 required check(s), 1 practice run(s). Resume them from their original sections; they are not counted as completed.

Writing and flash-card self-assessments are not automatically graded. Completion is not a mastery certificate.

Mixed practice

9/17/2026, 8:42:33 PM · Elapsed 0m 1s · Formative practice

Review submitted responses and attempts

First-try result: 7/7. Later corrections are recorded separately.

Which term fits this definition? The two replicated copies of a chromosome before their separation.

Self-report: Study again.

Reference: sister chromatids

Put these steps in order: The cell cycle and DNA replication

Options shown: Mitosis: nuclear chromosome distribution · S: DNA replication · G2: preparation for division · Cytokinesis: cytoplasmic division · G1: cell growth and normal activity

Attempt 1: G1: cell growth and normal activity → S: DNA replication → G2: preparation for division → Mitosis: nuclear chromosome distribution → Cytokinesis: cytoplasmic division — Correct.

Reference: G1: cell growth and normal activity → S: DNA replication → G2: preparation for division → Mitosis: nuclear chromosome distribution → Cytokinesis: cytoplasmic division

A model incorrectly inserts an S phase between meiosis I and II. What needs correction?

Options shown: All DNA should be destroyed after meiosis I · Meiosis II normally creates a diploid zygote · The second division normally distributes existing chromatids without another full replication · Meiosis I should be removed entirely

Attempt 1: The second division normally distributes existing chromatids without another full replication — Correct.

Reference: The second division normally distributes existing chromatids without another full replication

Identify the term illustrated: A gamete carries an allele combination different from the parental chromosome arrangement.

Attempt 1: recombination — Correct.

Reference: recombination

What does letter B identify?

Options shown: Meiosis I nondisjunction · Meiosis II nondisjunction

Attempt 1: Meiosis II nondisjunction — Correct.

Reference: Meiosis II nondisjunction

Select the TWO accurate statements about chromosomes, dna and chromosome sets.

Options shown: Chromatin is a different hereditary molecule from DNA. · A chromosome set means two sister chromatids. · An unreplicated chromosome has one DNA molecule; a replicated chromosome has two sister chromatids until they separate. · Homologues are not the same as two copies made by DNA replication.

Attempt 1: true-1 → true-2 — Correct.

Reference: An unreplicated chromosome has one DNA molecule; a replicated chromosome has two sister chromatids until they separate. · Homologues are not the same as two copies made by DNA replication.

Correct this incorrect statement: A sporophyte is the haploid gamete-producing stage.

Self-report: Study again.

Reference: The diploid multicellular generation that produces haploid spores by meiosis. A sporophyte makes spores by meiosis, not gametes directly in this model.

Which term matches this description? A developing partition that contributes to the new wall between dividing plant cells.

Options shown: cell plate · cell-cycle checkpoint · cleavage furrow · cytokinesis

Attempt 1: cell plate — Correct.

Reference: cell plate

Explain meiosis II.

Self-report: Study again.

Reference: The second meiotic division, in which sister chromatids separate.

Name the term described: One of each type of chromosome characteristic of a species.

Attempt 1: chromosome set — Correct.

Reference: chromosome set

Frayer work

chromosome — Draft

Meaning: An edited explanation.

Key features: A specific learner explanation 2.

Example: A specific learner explanation 3.

Non-example / common confusion: A specific learner explanation 4.

chromatin — Draft

Meaning: (not yet written)

Collected optional responses

Cell division and restoring tissue function

The comparison alone cannot isolate the proposed chemical effect. Hormone production and receptor response are distinct steps.

Textbook question work

Draft and saved question responses. Optional and ungraded.
