

All My Work

Your saved learning record for Patterns and Processes in Inheritance.

1 completed activity run. Required checks and formative practice are recorded separately.

Unfinished work: 0 required check(s), 1 practice run(s). Resume them from their original sections; they are not counted as completed.

Writing and flash-card self-assessments are not automatically graded. Completion is not a mastery certificate.

Mixed practice

Review submitted responses and attempts

First-try result: 6/6. Later corrections are recorded separately.

Correct this incorrect statement: Polygenic inheritance and multiple alleles are identical terms.

Self-report: Study again.

Reference: Inheritance in which multiple genes contribute to a trait. Polygenic does not mean many alleles at only one locus.

Identify the term illustrated: The simplified ABO model includes IA, IB and i.

Attempt 1: multiple alleles — Correct.

Reference: multiple alleles

Which term matches this description? An allele combination matching one of the original chromosome arrangements in the heterozygous parent.

Options shown: linkage phase · linked genes · parental combination · recombinant combination

Attempt 1: parental combination — Correct.

Reference: parental combination

What does letter A identify?

Options shown: Locus at 8 cM · Locus at 20 cM · 8 cM · Locus at 0 cM · 12 cM

Attempt 1: Locus at 0 cM — Correct.

Reference: Locus at 0 cM

Select the TWO accurate statements about genes, alleles, genotype and phenotype.

Options shown: A gene and a particular version of that gene are different concepts. · Each allele is a different chromosome set. · Genotype records the allele combination, not just the appearance. · Phenotype is always a pair of letters.

Attempt 1: true-1 → true-2 — Correct.

Reference: A gene and a particular version of that gene are different concepts. · Genotype records the allele combination, not just the appearance.

Put these steps in order: Mendel's experiments and segregation

Options shown: Define the parental genotypes · List one-allele gametes from each parent · Group offspring genotypes · Apply the stated phenotype relationship · Combine gametes at fertilization

Attempt 1: Define the parental genotypes → List one-allele gametes from each parent → Combine gametes at fertilization → Group offspring genotypes → Apply the stated phenotype relationship — Correct.

Reference: Define the parental genotypes → List one-allele gametes from each parent → Combine gametes at fertilization → Group offspring genotypes → Apply the stated

phenotype relationship

For $Aa \times Aa$, what is the probability of two specified successive aa offspring?

Self-report: Study again.

Reference: $1/16$. Multiply the independent probabilities: $1/4 \times 1/4 = 1/16$.

Explain genetic risk.

Self-report: Study again.

Reference: A probability or increased likelihood associated with genetic information in a specified context.

Which term fits this definition? A diagram tracing a specified trait through family relationships across generations.

Self-report: Study again.

Reference: pedigree

A red R_1R_1 plant crosses with pink R_1R_2 under incomplete dominance. What is the probability of white R_2R_2 offspring?

Options shown: $1/4 \cdot 1 \cdot 0 \cdot 1/2$

Attempt 1: 0 — Correct.

Reference: 0

Frayer work

gene — Draft

Meaning: An edited explanation.

Key features: A specific learner explanation 2.

Example: A specific learner explanation 3.

Collected optional responses

Biobanks and genetic information

The comparison alone cannot isolate the proposed chemical effect. Hormone production and receptor response are distinct steps.

Textbook question work

Draft and saved question responses. Optional and ungraded.
