

All My Work

Your saved learning record for Patterns and Processes in Inheritance.

1 completed activity run. Required checks and formative practice are recorded separately.

Unfinished work: 0 required check(s), 1 practice run(s). Resume them from their original sections; they are not counted as completed.

Writing and flash-card self-assessments are not automatically graded. Completion is not a mastery certificate.

Mixed practice

9/18/2026, 12:21:06 AM • Elapsed 0m 1s • Formative practice

Review submitted responses and attempts

First-try result: 7/7. Later corrections are recorded separately.

What does letter C identify?

Options shown: Aa • aa • AA

Attempt 1: Aa — Correct.

Reference: Aa

Which term matches this description? An allele combination matching one of the original chromosome arrangements in the heterozygous parent.

Options shown: parental combination • recombinant combination • linked genes • linkage phase

Attempt 1: parental combination — Correct.

Reference: parental combination

Name the term described: A blood-group system modeled with I^A , I^B and i alleles producing A, B, AB and O phenotypes.

Attempt 1: ABO blood group — Correct.

Reference: ABO blood group

Correct this incorrect statement: A gene is always an entire chromosome.

Self-report: Study again.

Reference: A DNA sequence that contributes to a functional product or inherited characteristic. A gene and a particular version of that gene are different concepts.

Put these steps in order: Mendel's experiments and segregation

Options shown: Apply the stated phenotype relationship · List one-allele gametes from each parent · Group offspring genotypes · Combine gametes at fertilization · Define the parental genotypes

Attempt 1: Define the parental genotypes → List one-allele gametes from each parent → Combine gametes at fertilization → Group offspring genotypes → Apply the stated phenotype relationship — Correct.

Reference: Define the parental genotypes → List one-allele gametes from each parent → Combine gametes at fertilization → Group offspring genotypes → Apply the stated phenotype relationship

Select the TWO accurate statements about test crosses and unknown genotypes.

Options shown: Homozygous always means dominant. · A heterozygote can share a phenotype with a homozygous dominant individual. · One recessive offspring can be informative; all dominant offspring in a small sample need not prove homozygosity. · Every difference from an expected ratio proves a new inheritance law.

Attempt 1: true-2 → true-1 — Correct.

Reference: A heterozygote can share a phenotype with a homozygous dominant individual. · One recessive offspring can be informative; all dominant offspring in a small sample need

not prove homozygosity.

Which term fits this definition? An observable or measurable characteristic resulting from genotype and its biological context.

Self-report: Study again.

Reference: phenotype

A temperature change alters a model organism's pigment production without changing its DNA sequence. What is the best conclusion?

Self-report: Study again.

Reference: Phenotype changed through a non-sequence environmental effect. Phenotype can change through expression or biochemical conditions without sequence change.

Identify the term illustrated: Two unaffected Aa parents can have an affected aa child.

Attempt 1: autosomal recessive — Correct.

Reference: autosomal recessive

A small pedigree fits both an autosomal and an X-linked model. What is the appropriate conclusion?

Options shown: Choose X-linked because it sounds more specific · More information is needed to distinguish the models · Ignore all phenotype observations · Both models are proven simultaneously

Attempt 1: More information is needed to distinguish the models — Correct.

Reference: More information is needed to distinguish the models

Frayer work

gene — Draft

Meaning: An edited explanation.

Key features: A specific learner explanation 2.

Example: A specific learner explanation 3.

Non-example / common confusion: A specific learner explanation 4.

allele — Draft

Meaning: (not yet written)

Collected optional responses

Biobanks and genetic information

The comparison alone cannot isolate the proposed chemical effect. Hormone production and receptor response are distinct steps.

Textbook question work

Draft and saved question responses. Optional and ungraded.

No textbook question work yet.
