

Optional generated practice for lessons 09 and 10

Static complete prompt inventory. Answers, hints and feedback withheld. This is not a native shuffled practice session. All 49 stored representations are present; related variants are not 49 distinct concepts. Use the lesson teaching first. A pathway item lists its supplied steps in their stored order; runtime shuffle behavior is not tested.

1. ch14-concept-menopause-flash

Explain menopause.

2. ch14-concept-menopause-reverse

Which term fits this definition? The end of menstrual cycling associated with declining ovarian follicular activity.

3. ch14-concept-menopause-misconception

Correct this incorrect statement: Reduced ovarian hormone production must mean FSH and LH are also low.

4. ch14-concept-menopause-blank

Name the term described: The end of menstrual cycling associated with declining ovarian follicular activity.

5. ch14-concept-hcg-flash

Explain hCG.

6. ch14-concept-hcg-reverse

Which term fits this definition? Human chorionic gonadotropin, released by developing trophoblast tissue in early pregnancy.

7. ch14-concept-hcg-misconception

Correct this incorrect statement: hCG and progesterone are two names for the same hormone.

8. ch14-concept-hcg-blank

Name the term described: Human chorionic gonadotropin, released by developing trophoblast tissue in early pregnancy.

9. ch14-concept-hormonal-contraception-flash

Explain hormonal contraception.

10. ch14-concept-hormonal-contraception-reverse

Which term fits this definition? Conception control using hormones or hormone-like substances to alter reproductive processes.

11. ch14-concept-hormonal-contraception-misconception

Correct this incorrect statement: Any hormonal method that prevents pregnancy also prevents every STI.

12. ch14-concept-hormonal-contraception-blank

Name the term described: Conception control using hormones or hormone-like substances to alter reproductive processes.

13. ch14-concept-sti-flash

Explain STI.

14. ch14-concept-sti-reverse

Which term fits this definition? A sexually transmitted infection.

15. ch14-concept-sti-misconception

Correct this incorrect statement: A person with no symptoms cannot have an STI.

16. ch14-concept-sti-blank

Name the term described: A sexually transmitted infection.

17. ch14-concept-pathogen-flash

Explain pathogen.

18. ch14-concept-pathogen-reverse

Which term fits this definition? An organism or infectious agent capable of causing disease.

19. ch14-concept-pathogen-misconception

Correct this incorrect statement: A pathogen is any reproductive hormone in the bloodstream.

20. ch14-concept-pathogen-blank

Name the term described: An organism or infectious agent capable of causing disease.

21. ch14-concept-pelvic-inflammatory-disease-flash

Explain pelvic inflammatory disease.

22. ch14-concept-pelvic-inflammatory-disease-reverse

Which term fits this definition? Inflammation involving upper female reproductive structures, often associated with infection.

23. ch14-concept-pelvic-inflammatory-disease-misconception

Correct this incorrect statement: Normal ovarian hormones guarantee that infection cannot damage an oviduct.

24. ch14-concept-pelvic-inflammatory-disease-blank

Name the term described: Inflammation involving upper female reproductive structures, often associated with infection.

25. ch14-concept-infertility-flash

Explain infertility.

26. ch14-concept-infertility-reverse

Which term fits this definition? Difficulty establishing a pregnancy due to one or more reproductive factors.

27. ch14-concept-infertility-misconception

Correct this incorrect statement: Infertility always means every gonad has stopped producing both hormones and gametes.

28. ch14-concept-infertility-blank

Name the term described: Difficulty establishing a pregnancy due to one or more reproductive factors.

29. ch14-concept-ectopic-pregnancy-flash

Explain ectopic pregnancy.

30. ch14-concept-ectopic-pregnancy-reverse

Which term fits this definition? A pregnancy implanted outside the normal uterine site.

31. ch14-concept-ectopic-pregnancy-misconception

Correct this incorrect statement: Normal fertilization in an oviduct is itself an ectopic pregnancy.

32. ch14-concept-ectopic-pregnancy-blank

Name the term described: A pregnancy implanted outside the normal uterine site.

33. ch14-import-OBJ_2131525

In a hypothetical case, scarring completely blocks both oviducts while ovarian hormone production remains normal. Which event can still occur?

- Parturition
- Fertilization
- Ovulation
- Implantation

34. ch14-import-OBJ_2131570

Another contraceptive, the birth control pill, causes negative feedback on the pituitary, which prevents the release of eggs. Typically, the hormones in the birth control pill are similar to

- Relaxin and gonadotropins
- FSH and LH
- Oxytocin and prolactin
- Estrogen and progesterone

35. ch14-import-OBJ_2131114

Which term describes the end of menstrual cycling associated with declining ovarian follicular activity?

- Menopause
- Ovulation
- Follicular development
- Menstruation

36. ch14-sequence-08

Put these steps in order: Supporting the lining in early pregnancy

- Developing trophoblast tissue releases hCG
- hCG supports the corpus luteum
- The corpus luteum continues hormone release
- Progesterone helps maintain the endometrium

37. ch14-application-16

Ovarian follicles respond less strongly while pituitary feedback detection remains functional. Why can gonadotropin levels rise?

- LH is made from the disappearing follicles
- Reduced ovarian response must permanently stop all hypothalamic activity
- The ovaries become the source of FSH
- Less ovarian hormone feedback allows greater pituitary stimulation

38. ch14-application-16-flash

Ovarian follicles respond less strongly while pituitary feedback detection remains functional. Why can gonadotropin levels rise? Explain your reasoning without answer choices.

39. ch14-application-17

In a combined hormonal-contraceptive model, FSH/LH support and the mid-cycle surge are suppressed. What is the intended ovarian consequence?

Choice 1: Reduced likelihood of follicle maturation and ovulation

Choice 2: A physical cut through both oviducts

Choice 3: More reliable release of several mature oocytes

Choice 4: Immediate destruction of every existing oocyte

40. ch14-application-17-flash

In a combined hormonal-contraceptive model, FSH/LH support and the mid-cycle surge are suppressed. What is the intended ovarian consequence? Explain your reasoning without answer choices.

41. ch14-application-18

A person has no visible symptoms. Which conclusion about an STI is justified?

- No infection can be present without pain
- Absence of symptoms alone cannot rule out an infection
- Symptoms must always appear before transmission is possible
- Asymptomatic infection cannot affect reproductive tissue

42. ch14-application-18-flash

A person has no visible symptoms. Which conclusion about an STI is justified? Explain your reasoning without answer choices.

43. ch14-application-19

After an untreated infection, scar tissue obstructs an oviduct. Why can fertility be reduced even if follicles still develop?

- Follicle development occurs only inside the oviduct
- The oviduct is the only source of estrogen
- The route needed for gametes to meet is disrupted
- The scar automatically changes every chromosome number

44. ch14-application-19-flash

After an untreated infection, scar tissue obstructs an oviduct. Why can fertility be reduced even if follicles still develop? Explain your reasoning without answer choices.

45. ch14-application-20

Which statement best describes a condom's role in STI prevention?

- It prevents infection by permanently suppressing FSH
- It guarantees protection against every STI in every use
- It cures an infection already present
- It can reduce transmission risk but does not eliminate every risk

46. ch14-application-20-flash

Which statement best describes a condom's role in STI prevention? Explain your reasoning without answer choices.

47. ch14-typed-19

Which early pregnancy signal supports the corpus luteum?

48. ch14-typed-20

An infection spreads into upper female reproductive structures and causes inflammation. Name the condition, or give its standard abbreviation.

49. ch14-multiple-select-5

Select every conclusion supported by this chapter's STI explanation.

- a: Some infections may be present without obvious symptoms.
- b: Scarring in an oviduct can interfere with reproduction.
- c: An online symptom list can establish a diagnosis.
- d: Every STI is a bacterial infection.
