

Module 7 | 1 of 4

Assignment

ASSIGNMENTS 7.1

Question 1 of 3 | 10 marks

Suppose your savings goal was \$300,000. Use the compound interest calculator to provide 5 different ways in which that amount could be saved using different start-up amounts, different levels of monthly savings, and different rates of return and indicate the total number of years of saving that each would require.

Question 2 of 3 | 15 marks

Now, suppose you wanted to aim for financial independence/retirement at age 60. Assume you will live to age 90 – let's hope it is longer. Decide/calculate how much money you would hope to have, per year, to live on from age 60 to 90. Then, use some online calculators to determine how much you would have to save by age 60 to be able to have your target amount of income to get you through to age 90. Assume you will have the maximum amount of CPP to help you out but, at this point, assume no other pension but just what you are able to save.

Question 3 of 3 | 20 marks

Suppose you have saved \$500 and you now get a job that will enable you to save \$40 a month. Assume your average rate of return on your savings will be 5%. Calculate how much you will have in savings in 40 years if you save \$40 a month. Next, compare the amount you will have in savings if you were able to save \$60 a month. Then, here is a challenging one. Suppose you were able to save \$40 a month for 5 years, \$100 a month for 10 years, and \$250 a month for 25 years – all at a rate of return of 5% – how much would you accumulate in total savings in 40 years?
