

Phase 2 — The Drive

Understand what directs effort, then build a realistic plan that includes values, support and recovery.

Reading and practice chapter

Use this chapter beside the learning website or as a reading route through the same lessons. Save written responses in the website or the format directed by your teacher.

Worked examples are labelled. Try the learner questions before checking the answer and feedback section at the end.

Fictional sport, academic and artistic examples are welcome. No private health details, personal beliefs or claims of perfect confidence are needed.

Reconciled learner reading chapter.

The phase case

Alex prepares for a school volleyball tryout

Alex is a fictional Grade 10 student. The school volleyball tryout is two weeks away. Alex enjoys playing games with friends and values contributing to a group. Repeating a serving drill is not always enjoyable, but Alex chooses it because becoming a reliable teammate matters. Alex also says, “Sometimes I practise because I would feel guilty if I stopped.” Those are different reasons, even when the practice looks the same.

Alex can attend two school practices this week. A late bus is available on Tuesday, but not Thursday. There is also a science presentation to prepare. At the last practice, Alex completed the preparation routine on six of ten planned serves. On four attempts, Alex rushed the setup after watching another player score. The coach offered to demonstrate the setup again. A classmate offered to practise together during a suitable school session.

For the assignment, treat these details as case evidence, not a report about a real student. You may add reasonable fictional details and label them as assumptions. Later, the case changes: Thursday's gym session is cancelled. Alex also reports that the current schedule leaves too little time to recover. Your job is to adjust the plan, not diagnose Alex or prescribe harder training.

Your opening response

Describe Alex's task and two practical constraints. What information would help you choose a realistic next action?

Learning goals

- I can distinguish direction and intensity using evidence from one situation.
- I can distinguish reasons for action without assigning a permanent label to a person.
- I can connect one environmental change to autonomy, competence or relatedness.
- I can connect one value to an action without judging a person's worth.
- I can write an accurate observation, choose an adjustment and explain evidence-based pride.
- I can distinguish three goal types and write a usable SMART process goal.
- I can identify information, support and a reasonable planning adjustment without making a diagnosis.
- I can adapt a plan when the situation changes and explain the evidence for the change.

02 · Where effort goes

Separate the amount of effort from the job that effort is doing.

Learning goal: I can distinguish direction and intensity using evidence from one situation.

Before you begin: Think of two people who spend the same amount of time practising different things.

Start with the task

Two students each spend twenty minutes preparing for a presentation. One practises explaining the main idea without reading. The other changes the title slide several times. Both are working. They are not working on the same thing. Before judging effort, ask what each action is meant to improve.

Motivation concerns the reasons and processes that get action started and keep it going. This phase begins with two useful dimensions: **direction** and **intensity**. Direction means where effort is aimed. Intensity means how much effort is applied. Time spent can give one clue, but time alone does not tell you either the quality or the purpose of the work.

Direction: choose a useful target

A volleyball player may aim to improve a reliable serving setup. A musician may aim to enter on the correct beat. A student may aim to explain evidence clearly. Each target gives practice a job. “Improve everything” is too broad to guide the next few minutes.

Direction also involves choosing between tasks. Repeating an already comfortable skill can feel productive. However, it might leave the main difficulty untouched. A useful question is, “Which part of this performance needs attention now?” The answer should come from evidence, such as feedback or a pattern across attempts.

Intensity: how much effort is applied?

Intensity describes the effort invested after a target is chosen. Two players may practise the same skill, but one engages carefully while the other barely attempts it. That difference may concern intensity. Do not decide why it happened from appearance alone. The second player might need clearer instructions, a different level of challenge, or support.

More intense work is not automatically better work. Repeating a misunderstood action with greater force does not supply the missing explanation. A useful plan joins an appropriate target with an amount of effort that fits the task and setting.

Discipline is not a fixed label

In this course, discipline means organizing and returning to useful actions over time. It is not a permanent label separating good people from bad people. Reasons, skills, time, feedback and the environment all affect what a person can do.

When a plan slips, inspect it before judging the person. Was the task clear? Was the action realistic? Was there a way to get feedback? A plan can need adjusting even when the performer cares about the goal. Later topics explain reasons for effort and the conditions that support it.

Worked example · fictional case

Equal time, different practice

Alex and Sam each practise for twenty minutes. Alex repeats a familiar serve. Sam checks the starting position, tries a correction and asks whether it changed the setup. Their practice time is equal, but their direction differs. Sam is targeting a specific part of the skill.

We cannot conclude that Sam is a better person or is trying harder. The evidence tells us what each session targets. A useful adjustment for Alex is to identify one feature to observe, rather than simply adding more minutes.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

02.1 · A student practises the opening sentence rather than the slide colours. Which dimension is most directly described?

- A. Direction: the aspect being practised.
- B. Intensity: how hard the student works.
- C. Recovery: how long the student rests.

02.2 · A performer repeats a misunderstood instruction with more effort. What is the most useful next step?

- A. Extend the session before checking anything.
- B. Clarify the instruction and choose one feature to observe.
- C. Decide that effort is unrelated to learning.

Explain the difference

Two performers work equally hard but improve different things. Explain their direction of effort and how it differs from intensity.

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

03 · Why we do the work

The same activity can be done for very different reasons.

Learning goal: I can distinguish reasons for action without assigning a permanent label to a person.

Before you begin: Use the performer's words, not their appearance, as the main evidence.

Look beneath the action

Three students attend the same rehearsal. One enjoys making music. One values contributing to the concert. One fears getting in trouble for missing it. Attendance looks the same, but the reasons differ. **Self-determination theory**, associated with Edward Deci and Richard Ryan, helps us name those differences.

Intrinsic motivation means doing an activity for its own interest or enjoyment. "I like playing this piece" is an example. **Extrinsic motivation** means doing it for a separable result or purpose. That purpose can be personally meaningful; extrinsic does not always mean someone is forcing the person.

Four forms of extrinsic regulation

External regulation centres on an outside demand, reward or consequence. A learner might practise to earn a reward or avoid punishment. The immediate reason is outside the activity itself.

Introjected regulation involves pressure that the person has taken inside. "I must practise or I am worthless" ties action to guilt or protecting self-worth. The pressure feels internal, but the action may still feel controlled rather than freely endorsed.

Identified regulation means accepting the importance of the action. "This drill helps a skill I value" gives a personally accepted reason. The drill does not have to be enjoyable.

Integrated regulation means that the accepted reason fits with broader values and identity. “Preparing reliably fits how I want to contribute as a teammate” is an example. Integrated regulation remains extrinsic: the activity serves a valued purpose rather than being done only for enjoyment.

Lack of intention is a separate idea

Amotivation describes a lack of intention to act. A learner may not see a purpose, may not believe the action will help, or may feel unable to influence the result. Do not describe it as the most controlled kind of intentional motivation. A useful response begins by understanding what is missing.

The diagram organizes reasons. It is not a compulsory ladder that everyone must climb. A person can have several reasons at once, and reasons can change between activities or situations. Someone may enjoy games, value repetitive practice and also feel pressure about selection.

Use the categories carefully

Ask what the person says about the activity. Do not assume that smiling proves intrinsic motivation or that effort proves integrated regulation. Rewards and feedback also depend on context. Information that helps someone understand progress is different from pressure that makes them feel controlled.

The practical question is not, “Which student deserves the best label?” It is, “What reason is supported by the evidence, and what would make the next action understandable and worthwhile?”

Worked example · fictional case

Enjoyment is not the same as a valued purpose

Maya says, “I enjoy the sound we make together.” That statement supports intrinsic motivation. Ren says, “Scales are repetitive, but they help me become the musician I want to be.” That statement supports a valued, potentially integrated reason. It does not establish that Ren enjoys scales.

Both reasons can support participation. We would need more information before making claims about either learner’s long-term behaviour.

Different reasons for the same practice

Compare the stated reason. This is not a compulsory ladder.

Amotivation · no intention to act

"I do not see a purpose in starting."

EXTRINSIC · a separable purpose

External

"I want the reward."

Introjected

"I would feel guilty if I stopped."

Identified

"This helps a skill I value."

Integrated

"This fits my wider values and identity."

Intrinsic · interest or enjoyment

"I enjoy the activity itself."

Integrated regulation remains extrinsic. A person can have more than one reason, and reasons can change.

FIGURE 1 · DIFFERENT REASONS FOR ACTION. Amotivation means no intention to act. Four extrinsic forms range from outside pressure to a purpose that fits values. Intrinsic motivation concerns enjoyment of the activity itself. Integrated regulation remains extrinsic. These are not compulsory stages or permanent labels for people.

Amotivation means no intention to act. Four extrinsic forms range from outside pressure to a purpose that fits values. Intrinsic motivation concerns enjoyment of the activity itself. Integrated regulation remains extrinsic. These are not compulsory stages or permanent labels for people.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

03.1 · “I do this repetitive drill because reliable preparation fits my values.” Which reason is most directly supported?

- A. Intrinsic enjoyment of the drill itself.
- B. External regulation through a reward.
- C. Integrated regulation connected to values.

03.2 · A student sees no purpose in a task and does not intend to start. What should you investigate first?

- A. Whether the task has meaning and feels possible to influence.
- B. Which reward proves the student is intrinsically motivated.
- C. Which fixed motivation type the student will always have.

Compare two reasons

Compare someone who enjoys the activity with someone who chooses it because it fits a value. What evidence distinguishes their reasons?

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

04 · Choice, progress and belonging

A practice environment can support motivation rather than only demand more effort.

Learning goal: I can connect one environmental change to autonomy, competence or relatedness.

Before you begin: Return to the difference between choosing an action and feeling pressured into it.

Change the conditions, not just the slogan

Imagine arriving at practice and receiving an unexplained task that feels impossible. Nobody answers questions, and partners exclude you. “Be motivated” does not address those conditions. Self-determination theory identifies three psychological needs that help us examine an environment: **autonomy, competence and relatedness**.

These needs are not prizes that only successful performers earn. Use them to ask what support a learner might need. A small change in the task or interaction can be more relevant than another speech about effort.

Autonomy: a meaningful sense of choice

Autonomy concerns experiencing an action as chosen and personally endorsed. It does not mean having no rules, ignoring safety or choosing only easy tasks. A teacher can set an appropriate learning target while explaining its purpose and offering useful choices within it.

For example, a learner might choose which of two suitable practice tasks to try first. They might help set a realistic review point. The choice should matter to the learning, not merely change a decorative detail. Clear reasons can also help someone understand why a constraint is necessary.

Competence: understanding how to make progress

Competence concerns feeling able to develop skill and affect what happens through action. It is not the claim that the learner already knows everything. Clear demonstrations, manageable steps and specific feedback can help connect practice to progress.

A task that is far beyond current understanding may need a smaller first step. A task that is too easy may need a suitable challenge. Feedback such as “Your setup stayed consistent on the last three attempts” provides information. “Be better” does not explain what to keep or change.

Relatedness: being included and supported

Relatedness concerns belonging and mattering to others. In a class, it can be supported by respectful partners, being included in a group and being able to ask for help. It does not require being popular, agreeing with everyone or sharing private information.

A support role can be enough for a plan: a teacher, coach or practice partner. You do not need to name a real person. The useful detail is what help the performer would request and how that request fits the task.

One change can support more than one need

A partner demonstration may support competence and relatedness. A choice between suitable tasks may support autonomy while allowing a better challenge level. Explain the strongest connection rather than forcing every change into all three categories.

Supporting a need is not a promise that motivation or performance will immediately improve. Ask what the learner experiences and observe what happens next. The point is to make an informed adjustment, then review it.

Worked example · fictional case

A welcoming first practice

A new player does not understand the serving setup and is left without a partner. The teacher pairs the learner with a respectful classmate and gives a short demonstration. The demonstration supports competence by making the next step clearer. The pairing may support relatedness by making participation more inclusive.

To check the change, ask whether the instructions are clearer and observe the next setup. Do not assume that being assigned a partner automatically creates belonging.

Three psychological needs

Ask what change would support this learner in this task.

Autonomy

A meaningful sense of choice

Offer a choice between two appropriate practice tasks.

Competence

A clear route toward progress

Demonstrate a manageable step and give useful feedback.

Relatedness

Belonging and support

Arrange respectful partners and make questions welcome.

One change can support more than one need. Check the learner's experience; improvement is not guaranteed.

FIGURE 2 · CHOICE, PROGRESS AND BELONGING. Autonomy is a meaningful sense of choice within appropriate constraints. Competence concerns opportunities to develop skill and influence progress. Relatedness concerns belonging and support. A demonstration, suitable choice or respectful partner can address a specific need; the learner's experience still needs checking.

Autonomy is a meaningful sense of choice within appropriate constraints. Competence concerns opportunities to develop skill and influence progress. Relatedness concerns belonging and support. A demonstration, suitable choice or respectful partner can address a specific need; the learner's experience still needs checking.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

04.1 · A teacher explains the purpose of a task and offers two appropriate ways to practise it. Which need is most directly supported?

- A. Relatedness through group popularity.
- B. Autonomy through meaningful choice.
- C. Competence through an automatic improvement.

04.2 · A new dancer feels lost during a long sequence. Which change most directly addresses competence?

- A. Tell the dancer that confidence will arrive eventually.
- B. Assign a more public performance immediately.
- C. Demonstrate a short section and give specific feedback on it.

Change the practice environment

Change one feature of this practice environment. Which need does it support, and why might it help?

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

05 · Values into action

A value becomes useful when you can connect it to something observable.

Learning goal: I can connect one value to an action without judging a person's worth.

Before you begin: Use the fictional case or a personal example you are comfortable discussing.

A direction, not a trophy

A **value** is a quality or direction that matters to a person. Examples include learning, contribution, fairness and care. A **goal** is a particular target. A learner may value learning and set a goal of explaining one difficult idea clearly. The value can continue after that goal is reached.

Values help organize choices when several things compete for time. They do not make every decision easy. A student can value both preparation and supporting a family activity. A workable plan needs to consider the situation rather than pretend that one value removes all conflicts.

Make the value visible in behaviour

“Contribution” is a label. “Arrive with the agreed part prepared and help a partner understand the next step” describes behaviour. Someone can observe whether the action happened. This makes the plan easier to explain and review.

Avoid using words such as “good” or “strong” as the only evidence. They judge the whole person without identifying an action. A useful response states what the performer will do, when they will do it and how it connects to the chosen value.

You do not have to prove private beliefs in this assignment. You can choose a suitable value for the fictional performer and explain a reasonable action. A teacher can assess that explanation without deciding whether the value is truly part of your identity.

Toward and away are about the choice

A toward-value action fits the direction in the case. An away-from-value action moves away from it. If a learner values improving understanding, asking about unclear feedback may be a toward action. Hiding the feedback without reading it may move away from that direction.

These descriptions are not permanent labels for people. One missed practice does not establish that someone lacks commitment. There may be a transport problem, a competing responsibility or missing information. Describe the decision and context before interpreting it.

Acting while uncertain

Entering an “arena” is a metaphor for beginning before feeling perfectly ready. Treat that as a metaphor for participating in learning despite ordinary uncertainty. A learner can ask a question, share a rough draft or try an appropriately supported new step without knowing the outcome.

It is not an instruction to ignore safety, injury or a lack of essential skill. A useful action may be to ask for help or change the task. Courage and careful planning can belong together.

Review the action, not the identity

At a review point, ask what happened and whether the action still fits. If it did not happen, identify a barrier and revise the plan. This produces a next step. “I am not the right kind of person” produces a judgment but no usable instruction.

Worked example · fictional case

Contribution during a rehearsal

A fictional musician values contribution to the ensemble. One toward action is to practise the agreed entrance and arrive ready to follow the conductor. An away action would be to ignore a known entrance problem while blaming the group.

If transport prevents attendance, contribution might instead involve contacting the teacher and arranging a suitable way to prepare. The value stays meaningful while the action changes with the constraint.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

05.1 · Which statement is an observable expression of contribution?

- A. Prepare the agreed role and offer relevant help during practice.
- B. Be a person who always has the right values.
- C. Feel completely motivated before every session.

05.2 · Alex cannot attend because the late bus is unavailable. What is the most useful values-based response?

- A. Treat attendance as the only possible sign of commitment.
- B. Ignore the constraint because values should be non-negotiable.
- C. Discuss another suitable preparation action and explain how it serves contribution.

Connect a value to behaviour

Choose one value for the fictional performer. Describe one action that expresses it and one action that would move away from it.

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

06 · Responding to mistakes

Keep the useful information in an error without turning it into a judgment of the whole person.

Learning goal: I can write an accurate observation, choose an adjustment and explain evidence-based pride.

Before you begin: A useful response does not pretend the mistake never happened.

An error can become information

A student misses an entrance and thinks, “I am useless.” The entrance was missed, but the conclusion about the whole person goes beyond that event. Compare it with, “I lost the count while watching the audience.” The second statement identifies something that can be investigated and changed.

A **fixed or entity view** treats ability as something largely set that must be displayed. A **growth or incremental view** treats skill as something that can develop through practice, strategy, feedback and time. These are ways of interpreting learning, not permanent types of student.

Growth is more than praising effort

“Try harder” is not a complete learning strategy. A learner may be repeating an error because the instruction is unclear. Useful feedback identifies what happened, offers a relevant adjustment and gives a way to check the next attempt.

For example, “Practise the first sentence more slowly and check whether the main idea is clear” gives a task. “You are talented” may feel encouraging, but does not explain that task. Praise should not replace information about learning.

A growth-oriented response also has limits. Practice does not guarantee every desired result. A learner may need a different method, more instruction, time or appropriate support. Recognizing that need is part of adjusting the process, not evidence that effort is pointless.

Behaviour and the whole self

A useful distinction separates **guilt**, which can focus on an action, from **shame**, which can become a global judgment about the person. “I did not prepare the agreed section” identifies behaviour. “I am a failure” describes the whole self.

Use this distinction to make the response more specific. It is not a tool for diagnosing a classmate’s emotions. Nor does it mean a student must feel guilty to improve. A factual observation and repair action can be useful without making a claim about how someone should feel.

What kind of pride is supported?

Authentic pride connects achievement to evidence such as preparation, effort and skill development. “I used the feedback and made the entrance more consistent” identifies something worth keeping. **Hubristic pride** centres on a broad claim of superiority, such as “I am naturally better than everyone.”

The practical difference is what the statement lets the performer review. Specific evidence can identify a useful process. A superiority claim does not explain what to repeat and can make correction seem like an attack on status.

Use a three-part response

State the observation. Choose one adjustment. Decide what would show whether it helped. Keep both success and mistakes specific. A strong explanation can recognize progress and still identify something to work on next.

Worked example · fictional case

A serve after feedback

Alex says, “I rushed my setup after looking at another player’s result.” The proposed adjustment is to use the practised setup and target cue on the next planned attempt. The review checks whether the routine was used, separately from whether the serve scored.

If the setup becomes more consistent, Alex can recognize that progress. “I used the feedback” is evidence-based pride. It does not require claiming to be a naturally superior player.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

06.1 · Which statement focuses on behaviour rather than judging the whole person?

- A. I am the kind of person who always fails.
- B. I skipped the agreed preparation step before this attempt.
- C. My ability has been permanently exposed.

06.2 · After a clearer presentation, which response best connects pride to evidence?

- A. My explanation improved after I tested it with a partner.
- B. This proves I no longer need feedback.
- C. I must be naturally better than the rest of the class.

Turn a judgment into a next step

Rewrite “I failed because I am useless” as an observation and a useful adjustment. Explain what changed.

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

07 · Goals you can use

Connect the result you care about to an action you can practise and review.

Learning goal: I can distinguish three goal types and write a usable SMART process goal.

Before you begin: Use one performance situation for all three goal types.

Put a job on the calendar

“I want to improve” gives a direction but not a plan. What will the performer do? In which setting? How will they check it? A useful goal helps answer those questions. It should also fit the performer’s time, current learning and wider responsibilities.

A broad priority, such as learning or contribution, can guide several goals. A specific goal chooses one target within that direction. Do not confuse having an important priority with having a workable action for this week.

Three goal types

An **outcome goal** concerns a result relative to others, such as winning a match or earning a place in a group. Other people and conditions influence it. Caring about the outcome is understandable, but the performer cannot guarantee it through a thought.

A **performance goal** concerns a personal standard. Examples include a target serving percentage or explaining a topic within an agreed time. It can help track progress, but execution and conditions still affect the result.

A **process goal** concerns an action used in the task. Examples include using a preparation routine, checking the evidence before making a claim, or following the conductor’s entrance cue. These actions are usually more directly controllable than the final result. They are not completely independent of circumstances.

Use SMART as a planning check

In this course, SMART means **Specific, Measurable, Achievable, Relevant and Time-bound**. Specific names the action. Measurable explains what can be observed or recorded. Achievable checks whether it is workable. Relevant connects it to the actual need. Time-bound sets a review point.

For example: “During the next two school practices, Alex will use the agreed setup before ten planned serves and record whether it was used. Alex will review the record with the coach after the second practice.” The number of attempts is a fictional planning choice, not a training prescription for everyone.

A measurable goal can still be a poor fit. It may ignore transport, overload the schedule or focus on a result that depends heavily on others. SMART does not replace judgment about those conditions.

Make the next action manageable

Keep the action clear and short. A long list of simultaneous cues can make execution harder to organize. Choose the current learning need and a suitable challenge. The plan can include a longer-term aim while making the next step small enough to begin.

Review action and result separately

A player may follow the routine and miss. Another may skip it and score. Record the planned action and the outcome separately. Then inspect a pattern across attempts and decide what to adjust. One result does not prove that the routine caused success or failure.

Worked example · fictional case

Three goals for one presentation

Outcome: be selected to present at the school showcase. Performance: explain the example within the agreed presentation length. Process: use the evidence card to connect each claim to a reason.

The process goal gives the student an action during rehearsal. The performance standard helps review the rehearsal. The selection outcome still depends on other presentations and the selection process.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

07.1 · Which is a performance goal rather than an outcome or process goal?

- A. Earn the final place on a team.
- B. Use the agreed setup before each planned serve.
- C. Reach a personal target serving percentage.

07.2 · Alex uses the routine but misses a serve. What should the record say?

- A. The routine was used and the serve missed; review the pattern across attempts.
- B. The miss proves the routine cannot help.
- C. Only the result should be recorded because the action does not matter.

Build one connected goal set

Write an outcome, performance and process goal for the same situation. Explain which action the performer can work on next.

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

08 · Effort, recovery and support

A useful plan changes when the demands no longer fit the performer's resources.

Learning goal: I can identify information, support and a reasonable planning adjustment without making a diagnosis.

Before you begin: Treat the case as a planning problem, not a test of toughness.

Effort is only part of a plan

A performer can care deeply about a goal and still struggle with the current schedule. More practice, homework, travel and other demands all take time. When the plan no longer fits, “push harder” may ignore the real problem. A useful review considers both what is being asked and the resources available.

Recovery means allowing the resources and time needed after demanding activity. In this course, it is part of planning. It is not a reward that must be earned by reaching a score. Nor is one feeling enough to calculate exactly how much recovery a person needs.

Read the growth model carefully

“Stress plus rest equals growth” is a shorthand for considering challenge and recovery together. Treat it as a simplified model, not a literal equation. Appropriate challenge, learning and recovery can support development. They do not guarantee improvement after every session or tell every learner to follow the same schedule.

The **SAID principle** refers to specific adaptations to imposed demands. At this introductory level, the useful planning point is that the kind of task matters. Practising an explanation is different from training a physical skill. Neither a slogan nor a graph gives a personal training dose.

Describe patterns without diagnosing

Training discussions may refer to acute fatigue, functional overreaching, nonfunctional overreaching and overtraining syndrome. These terms describe different responses to demands and recovery. They are not categories students should assign to themselves from a short symptom checklist.

Temporary fatigue after a demanding activity is different from a continuing pattern of difficulty. However, a classroom scenario cannot establish the cause of persistent tiredness, changes in sleep or falling performance. The same observation can need more context and appropriate assessment.

Do not decide that a struggling performer is lazy or that high motivation means continuing is safe. Motivation and readiness are different questions. If a person is worried about ongoing symptoms, a trusted adult and suitable qualified support are more appropriate than a motivational test.

Ask useful questions

Start with practical information. What changed in the schedule? Are the instructions clear? What commitments compete for time? What opportunities for rest and support are already available? The performer does not need to share private health details in this assignment.

Then identify a discussion or adjustment. A teacher might help reorganize deadlines. A coach might review the planned activity. A support request should explain the problem and ask for appropriate help, rather than prescribe a diagnosis or treatment.

Keep the review open

A plan is a starting decision, not proof that the problem is solved. Decide when to review it and what information would matter. Continued difficulty can be a reason for more support, not a reason to blame the performer for failing to follow the plan perfectly.

Worked example · fictional case

When the schedule stops fitting

Alex has two practices, a presentation deadline and limited transport. Alex reports struggling to recover under the current schedule. A reasonable first step is to discuss the demands with the teacher or coach and ask which planned activities can be adjusted.

The class task is to describe the information and support needed. It is not to diagnose overtraining, decide whether pain is “only effort,” or prescribe a harder session.

Notice · discuss · adjust

A planning sequence, not a diagnostic scale.

Notice the pattern

Describe the changed demands and what the performer reports.

Seek appropriate support

Ask a teacher, coach or trusted adult about the situation.

Discuss an adjustment

Consider the schedule and available resources without prescribing treatment.

Review what happens

Look at the agreed action and whether more support is needed.

Persistent difficulty is not proof of weak motivation. A short classroom case cannot diagnose a condition.

FIGURE 3 · RECOVERY AS A PLANNING AND SUPPORT DECISION. Describe the pattern, seek appropriate support, discuss an adjustment and review what happens. A case does not establish overtraining, a personal recovery deadline or a safe training dose. Motivation and readiness are different questions.

Describe the pattern, seek appropriate support, discuss an adjustment and review what happens. A case does not establish overtraining, a personal recovery deadline or a safe training dose. Motivation and readiness are different questions.

Challenge and recovery: a simplified model

One possible pattern—not a prediction for a particular learner.

Useful challenge, instruction, practice and recovery may support development. The line does not provide a training dose or guarantee growth.

FIGURE 4 · A QUALIFIED GROWTH MODEL. A schematic curve shows a possible dip and later improvement across demand and recovery. There are no personal measurement units. The useful teaching point is to consider suitable challenge, instruction and recovery together, not to promise growth after each session.

A schematic curve shows a possible dip and later improvement across demand and recovery. There are no personal measurement units. The useful teaching point is to consider suitable challenge, instruction and recovery together, not to promise growth after each session.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

08.1 · What does the growth diagram provide in this lesson?

- A. A fixed recovery deadline for every learner.
- B. A simplified reminder to consider challenge and recovery together.
- C. A diagnostic test based on the shape of a line.

08.2 · A learner reports continuing difficulty recovering while trying very hard. What response best fits this lesson?

- A. Assume effort proves readiness for a harder session.
- B. Use the report to assign an overtraining diagnosis.
- C. Review the demands and seek suitable support about an adjustment.

Make a support-and-adjustment decision

The performer is struggling to recover. What information and support would you seek, and what adjustment could be discussed?

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

09 · Make the plan fit the situation

A workable plan accounts for time, transport, feedback and support.

Learning goal: I can adapt a plan when the situation changes and explain the evidence for the change.

Before you begin: Bring together direction, reasons, needs, values, goals and recovery.

The same person can act differently

A learner speaks freely in a small rehearsal but becomes quiet in an unfamiliar group. Another works carefully alone but benefits from a partner when a task is unclear. These examples show why one label, such as “motivated” or “unmotivated,” may miss important information.

A **person-by-situation view** considers both the person and the conditions. Relevant details can include experience, reasons for participating, the task, feedback, resources and social setting. The question is how these features interact in this case, not which permanent category the person belongs in.

Social settings do not affect everyone the same way

An audience, partner or team can change a performance situation. A familiar skill and an unfamiliar skill may need different preparation. A supportive partner and an evaluative audience are also different conditions.

Do not prescribe solitude or group work from a brief personality label. Instead, describe the task and compare evidence. Does the learner understand the instruction? What does the partner contribute? What has changed when the difficulty appears? A reasonable plan may involve both independent preparation and a supported review.

Make constraints visible

A plan is not realistic simply because it is written neatly. Check the actual week. Time, transport, access to equipment, other deadlines and available support can affect what happens. These are conditions to consider, not excuses to dismiss automatically.

For Alex, a Thursday practice may not be possible without transport. A science presentation also needs preparation. A usable plan can prioritize one suitable school practice, a short planning task and a check-in. The exact choice should fit the case and any guidance about the activity.

Use an if-then plan

An **if-then plan** connects a likely barrier to a response. “If the gym session is cancelled, then I will ask the coach which available preparation task still fits the goal” is more useful than “I will never miss practice.” It names both the trigger and the next action.

Not every disruption can be predicted. Leave room to pause, ask questions or choose a different response when new information appears. An automatic response should not override safety or ignore a changed demand.

Review the plan with evidence

Choose a review point and identify what to inspect: actions completed, feedback, remaining confusion and practical barriers. Keep the final outcome separate from the actions used. A single good result does not establish that every part of the plan was necessary.

When the plan needs changing, explain why. Connect the revision to the constraint or observation. This is where the phase comes together: choose useful work, understand the reasons, support the conditions, make actions realistic and review what happens.

Worked example · fictional case

Thursday's session is cancelled

Alex's original plan includes Tuesday and Thursday school practice. Thursday is cancelled. Simply adding a late off-site session would ignore the transport limit and the presentation deadline.

A revised plan keeps Tuesday's agreed practice, asks the coach for a suitable alternative and uses an available period to review the serving record. The review checks whether the revised action still supports the goal. The change follows evidence about the situation, not a judgment that Alex lacks discipline.

The performer and the situation

Look at their interaction before adapting the plan.

Observe the change. Explain the adjustment. Review the evidence.

FIGURE 5 • PERSON BY SITUATION. Consider the performer's experience, reasons and resources alongside the task, time, transport, feedback and social setting. Choose an action that fits both. A change in performance does not establish a permanent personality type.

Consider the performer's experience, reasons and resources alongside the task, time, transport, feedback and social setting. Choose an action that fits both. A change in performance does not establish a permanent personality type.

A usable motivation plan

Bring the parts together after learning each one.

Return to the plan when the situation changes.

FIGURE 6 · A USABLE MOTIVATION PLAN. Choose direction and reasons, connect values and support, plan realistic goals and resources, then review evidence and adapt. The sequence organizes decisions; it does not measure character or guarantee a result.

Choose direction and reasons, connect values and support, plan realistic goals and resources, then review evidence and adapt. The sequence organizes decisions; it does not measure character or guarantee a result.

Try the concept checks

Choose before checking. Explanations are in Answers and feedback.

09.1 · A student works differently with a supportive partner than with an unfamiliar audience. What should you examine?

- A. The task and social conditions, as well as the learner's experience.
- B. A permanent personality type that predicts every situation.
- C. Only the final score, without the conditions.

09.2 · Which if-then plan responds to a real constraint?

- A. If I feel uncertain, I will pretend the plan cannot fail.
- B. If transport changes, I will discuss an available preparation option that still serves the goal.
- C. If a session is cancelled, I will double every later session regardless of the schedule.

Adapt the plan

Adapt a weekly plan when time, transport or support changes. Explain why the original plan needs adjusting.

Write two to four sentences using case evidence, a choice and a reason. Save this response for Build.

10 · Decision practice

Complete all three cases with reasons, then the transfer below. These are the same decisions in the guided and untimed website pathways. The timed game is optional.

Case 1 · Same activity, different reasons

Two fictional learners attend the same art workshop. Jo enjoys experimenting with colour. Lee finds the exercises repetitive but chooses them because developing a careful creative practice fits an important value. What is the best interpretation?

- A. Both must be intrinsically motivated because both attend.
- B. Jo describes enjoyment; Lee describes a personally endorsed purpose.
- C. Lee must be controlled by someone else because the exercises are not enjoyable.

Explain: What evidence supports your response? What would you check next?

Case 2 · A practice that leaves a learner behind

A new player receives a long instruction without a demonstration. The first task is too difficult to understand, and the player is repeatedly left without a partner. What is the most useful first change?

- A. Demand more effort before changing the task.
- B. Assign a public ranking to make the goal important.
- C. Demonstrate a manageable step and arrange a respectful practice partner.

Explain: What evidence supports your response? What would you check next?

Case 3 · The week no longer fits

A fictional performer loses access to a planned session. A deadline has moved earlier, and the performer reports difficulty recovering. What response best fits the evidence?

- A. Review the schedule with suitable support and discuss which demands can change.
- B. Diagnose overtraining from this description alone.
- C. Add extra work to prove commitment despite the changes.

Explain: What evidence supports your response? What would you check next?

Transfer the idea

Choose a different school, art or recreational situation. Identify one reason for action and one changed constraint. Explain a suitable adjustment and one thing you would check next.

11 · My Motivation Plan

Use the same case throughout. Each field asks for a short structured response, not an essay. Earlier lesson answers can be reused and adapted. The website protects edited Build responses with a replacement confirmation.

The five steps contain twelve required evidence fields. Your teacher evaluates the reasoning and plan, not a self-reported feeling, game score or word count.

Step 1 · Choose the situation

Use the same case. Explain the evidence, your decision and why the choice fits.

Task, performer and constraint

Name the task and two case details that affect the plan. Use the supplied case or a suitable fictional alternative.

Two reasons for doing the task

Distinguish two reasons using the performer's words. Explain which concepts apply.

Worked field examples are collected in Answers and feedback. Use them to check the reasoning rather than copy without adapting.

Step 2 · Connect values and support

Use the same case. Explain the evidence, your decision and why the choice fits.

A value expressed in action

Choose one value. Describe one toward action and one action that would move away from it.

A need and an environmental change

Name a need, identify the case evidence and propose a specific change.

Worked field examples are collected in Answers and feedback. Use them to check the reasoning rather than copy without adapting.

Step 3 · Make an achievable plan

Use the same case. Explain the evidence, your decision and why the choice fits.

Outcome, performance and process goals

Write all three for the same task. Make the process action reviewable using SMART.

Realistic actions and review point

State when suitable actions can happen, what support is available and when the record will be reviewed. Do not prescribe extra training.

Worked field examples are collected in Answers and feedback. Use them to check the reasoning rather than copy without adapting.

Step 4 · Respond and get support

Use the same case. Explain the evidence, your decision and why the choice fits.

A barrier and a response

Connect a likely trigger to one realistic action. State when you would ask for advice instead.

A support role and a request

Use a role rather than a real person's name. Write the actual question or request.

A recovery-related planning decision

Identify information and appropriate support. Suggest what could be discussed, without diagnosing or prescribing treatment.

Worked field examples are collected in Answers and feedback. Use them to check the reasoning rather than copy without adapting.

Step 5 · Review and adapt

Use the same case. Explain the evidence, your decision and why the choice fits.

Evidence and a revision

Choose one observation from the case or a labelled hypothetical record. Explain what to keep or change.

Adapt to a new constraint

New case: a musician now has half the usual rehearsal time and cannot meet their partner. Apply the ideas without copying the volleyball schedule.

Explain a choice and a limitation

Justify one decision using a course concept. State what the plan cannot establish.

Worked field examples are collected in Answers and feedback. Use them to check the reasoning rather than copy without adapting.

Build review criteria

The levels describe evidence, not an automatic numeric grade.

Concept accuracy

Not yet shown: Key ideas are missing or incorrect.

Developing: Some relevant ideas appear, but distinctions need clarification.

Clear: Terms and distinctions are accurate in the stated case.

Thoughtful: Accurate distinctions are carried into a changed situation, with relevant limits.

Evidence and task fit

Not yet shown: The response does not use the case.

Developing: Some evidence is named, but the choice is weakly connected.

Clear: The selected response is supported by relevant case evidence.

Thoughtful: The response weighs relevant evidence and explains why an alternative fits less well.

Usable plan

Not yet shown: The plan is missing or cannot be followed.

Developing: Actions are present but vague or incomplete.

Clear: The sequence, cues and support are specific and workable.

Thoughtful: The plan remains concise while providing a sensible alternative when conditions change.

Reasoning and adaptation

Not yet shown: Reasons and adjustments are not shown.

Developing: A reason or change is suggested without enough explanation.

Clear: Choices and adjustments are explained using the task.

Thoughtful: The response explains tradeoffs, limitations and what evidence would prompt another change.

12 · Written review

Write a first explanation before checking the answer section. Then explain a revision, or explain why the answer fits and add a useful example or limit. The website keeps the first-answer snapshot.

Review 1

Explain the difference between intrinsic motivation and integrated regulation. Use one activity.

First explanation: two to four sentences.

After comparison: what did you clarify, correct or strengthen?

Review 2

A learner values improvement but cannot understand a task and is excluded from a group. Explain one useful environmental change.

First explanation: two to four sentences.

After comparison: what did you clarify, correct or strengthen?

Review 3

Correct this claim: "If someone works hard enough, they should never need to change their plan."

First explanation: two to four sentences.

After comparison: what did you clarify, correct or strengthen?

Review 4

Choose one earlier response. What specific distinction or piece of evidence would make it clearer?

First explanation: two to four sentences.

After comparison: what did you clarify, correct or strengthen?

Final checkpoint

Answer all questions before checking the explanations. The website saves attempts and uses a 70% local practice threshold. This is not a teacher grade or an LMS submission.

1 · Two learners invest similar effort: one rehearses the main explanation and one polishes slide colours. What differs most directly?

- A. Their direction of effort.
- B. Their amount of effort must differ.
- C. Their level of trait anxiety.
- D. Their recovery category.

2 · “This repetitive practice fits the reliable teammate I want to be, even when it is not fun.” Which interpretation fits?

- A. Intrinsic enjoyment alone.
- B. Integrated regulation, an autonomous extrinsic reason.
- C. Amotivation because the drill is repetitive.
- D. External regulation because every practice is assigned.

3 · A teacher offers meaningful task choices, clear feedback and respectful partners. What is the best explanation?

- A. These remove all performance pressure.
- B. These guarantee intrinsic enjoyment.
- C. These may support autonomy, competence and relatedness.
- D. These prove that effort will be identical for everyone.

4 · Which evidence best connects a value of contribution to action?

- A. The performer says they are always a good person.
- B. The performer feels no uncertainty.
- C. The performer chooses the hardest possible task.
- D. The performer prepares the agreed part and offers relevant help.

5 · After an error, which response best supports learning?

- A. State what happened, try a relevant adjustment and inspect the next attempt.
- B. Praise effort without looking at the method.
- C. Decide the error reveals permanent ability.
- D. Repeat the same instruction more loudly.

6 · Which statement is behaviour-focused rather than a global self-judgment?

- A. I am useless when a task becomes difficult.
- B. I did not use the agreed preparation step on this attempt.
- C. My whole identity is the problem.
- D. This error proves I cannot learn.

7 · Which statement best illustrates evidence-based authentic pride?

- A. I am above feedback because I succeeded.
- B. My result proves I am naturally superior.
- C. I used the feedback and made my setup more consistent.
- D. I deserve a result regardless of preparation.

8 · A learner wants to deliver a clearer explanation. Which is a process goal?

- A. Be chosen as the best speaker.
- B. Receive the highest audience rating.
- C. Reach an agreed presentation standard.
- D. Connect each claim to one relevant example during rehearsal.

9 · A performer reports ongoing difficulty recovering after several schedule changes. What is the best classroom decision?

- A. Discuss the changed demands and appropriate support before deciding on adjustments.
- B. Diagnose overtraining from the report alone.
- C. Prescribe extra work because motivation remains high.
- D. Use a toughness rule to distinguish injury from effort.

10 · A learner performs differently alone and with a supportive partner. What evidence is most useful for adapting the plan?

- A. A fixed personality label assigned from one result.
- B. The task, available feedback and what changed in the social setting.
- C. Only the performer's highest score.
- D. An assumption that group work always improves performance.

Glossary and sources

Motivation

Reasons and processes that start, direct and sustain action.

Direction

Where effort is aimed.

Intensity

How much effort is applied.

Intrinsic motivation

Doing an activity for its own interest or enjoyment.

Extrinsic motivation

Doing an activity for a separable purpose or result.

External regulation

Acting for an outside demand, reward or consequence.

Introjected regulation

Acting under internal pressure, such as guilt or protecting self-worth.

Identified regulation

Acting because a purpose is personally accepted as important.

Integrated regulation

Acting for a purpose that fits broader values and identity; it remains extrinsic.

Amotivation

Lack of intention to act.

Autonomy

Experiencing action as chosen and endorsed, within appropriate constraints.

Competence

Experiencing opportunities to develop skill and affect progress.

Relatedness

Experiencing belonging and support.

Value

A meaningful quality or direction that guides choices.

Growth mindset

A view that skill can develop through strategy, feedback, effort and time.

Guilt and shame

A distinction between focusing on behaviour and making a global judgment about the self; not a diagnostic checklist.

Authentic pride

Recognizing achievement through specific evidence of preparation, learning or effort.

Hubristic pride

A broad superiority claim rather than an explanation of a useful process.

Outcome, performance and process goals

A result relative to others; a personal standard; and an action used in the task.

Recovery

Time and resources after demands, considered as part of a realistic plan.

SAID

Specific adaptations to imposed demands; an introductory principle, not a personal training prescription.

Acute fatigue

Temporary fatigue following demand; context matters.

Functional overreaching

A term for planned short-term performance reduction followed by recovery and improvement; not a learner diagnosis.

Nonfunctional overreaching

A term used when reduced performance is not followed by the intended recovery benefit; assessment needs context.

Overtraining syndrome

A clinical sport-science term for persistent difficulties that cannot be diagnosed from this classroom activity.

Person by situation

Considering how the performer and conditions interact in a particular task.

If-then plan

A likely trigger linked to a suitable next action.

Answers and feedback

Use this section after trying the questions. Compare the ideas and evidence rather than matching every word. Written responses are not automatically marked.

02 · Where effort goes

Check 02.1: A. The choice identifies where effort is aimed. We need more information to describe the amount of effort.

Check 02.2: B. Clarifying the task addresses the problem stated in the case. Effort still matters, but more of the same action may repeat the misunderstanding.

Written application: look for

- Name what each performer is trying to improve.
- Distinguish the target from the amount of effort.
- Avoid treating one observation as a character judgment.

03 · Why we do the work

Check 03.1: C. The stated reason is a value-consistent purpose, not enjoyment of the drill. Integrated regulation remains a form of extrinsic motivation.

Check 03.2: A. The case suggests a lack of intention. Clarifying purpose, task understanding and available support is more useful than assigning a permanent type.

Written application: look for

- Use the words or action-purpose stated in the case.
- Keep intrinsic enjoyment distinct from a valued extrinsic purpose.
- Recognize that reasons can overlap or change.

04 · Choice, progress and belonging

Check 04.1: B. The choice and explanation support ownership within a suitable constraint. They do not remove the learning target or guarantee improvement.

Check 04.2: C. A clear, manageable section links action to feedback. The next check is whether the learner understands and can use the step, not whether they report perfect confidence.

Written application: look for

- Name the problem in the case.
- Propose a specific change and connect it to one need.
- Describe what to ask or observe after the change.

05 · Values into action

Check 05.1: A. The first statement describes actions that can be followed and reviewed. The other statements ask for a broad identity or internal feeling.

Check 05.2: C. The transport constraint changes what is possible. An adapted action can still express the value without pretending the barrier does not exist.

Written application: look for

- Name one value and explain it in ordinary language.
- Describe two observable actions in the same situation.
- Explain the connection without judging the whole person.

06 · Responding to mistakes

Check 06.1: B. The preparation step is a specific behaviour. It can be reviewed and changed without making the event a verdict about the whole person.

Check 06.2: A. The first response links improvement to a relevant process. It recognizes progress while leaving room for further feedback.

Written application: look for

- State a specific event rather than a global identity claim.
- Choose a relevant adjustment and a way to review it.
- Recognize effort or progress without promising a result.

07 · Goals you can use

Check 07.1: C. A personal percentage is a performance standard. Selection is an outcome, and using the setup is an action.

Check 07.2: A. The action and result are different observations. Keeping both supports a more careful review than drawing a conclusion from one serve.

Written application: look for

- Keep all three goals in the same situation.
- Make the process goal an observable action.
- Include a realistic review point and distinguish action from result.

08 · Effort, recovery and support

Check 08.1: B. The diagram organizes a planning idea. It does not supply personal recovery times or diagnose a condition.

Check 08.2: C. The report supports asking questions and discussing support. It does not establish a diagnosis, a safe workload or a failure of motivation.

Written application: look for

- Identify the demands or changes described in the case.
- Name a support role and a specific question or request.
- Suggest a planning discussion without diagnosing or prescribing treatment.

09 · Make the plan fit the situation

Check 09.1: A. The changed social conditions are relevant evidence. One comparison cannot establish a permanent type or a universal prescription.

Check 09.2: B. The response acknowledges the transport constraint and preserves the learning purpose. It leaves room for appropriate advice rather than assuming more activity is always possible.

Written application: look for

- Name the changed constraint.

- Describe a realistic revised action and support request.
- Explain how the change preserves a useful purpose and how it will be reviewed.

Decision cases

Case 1: B. The reason matters. Enjoyment of the activity supports intrinsic motivation. A value-consistent purpose can be autonomous while remaining extrinsic. Attendance alone does not distinguish them.

Case 2: C. The demonstration addresses competence, and the partner may support relatedness. Check the learner's experience afterward. The change does not guarantee a particular feeling or result.

Case 3: A. The case supports a planning review and a support request. It does not establish a diagnosis or show that more work is safe or useful. Specify what information would guide the adjustment.

Transfer: identify a genuinely different situation, use its evidence to choose a response and explain a relevant limit or adjustment.

Build field examples

Task, performer and constraint

Alex is preparing for a school volleyball tryout. There are two school practice opportunities, limited Thursday transport and a presentation deadline.

Two reasons for doing the task

Alex enjoys games, an intrinsic reason. Alex also chooses serving practice because reliable contribution fits a value, a personally endorsed extrinsic reason.

A value expressed in action

Contribution could mean preparing the agreed role and asking about an unclear setup. Ignoring the known issue while blaming teammates would move away from that value.

A need and an environmental change

A short demonstration could support competence because Alex is still learning the setup. A respectful partner could make practice more inclusive. Check whether the instructions are clearer.

Outcome, performance and process goals

Outcome: earn a team place. Performance: improve a personally agreed serving standard. Process: use the agreed setup on ten planned serves during the next two available practices and review the record.

Realistic actions and review point

Keep Tuesday's planned practice, reserve time for the presentation and ask about an available preparation option after the cancellation. Review the serving record with the coach at the next suitable session.

A barrier and a response

If the gym session is cancelled, Alex will ask which available preparation action still fits the goal rather than add an unsuitable late session.

A support role and a request

Ask the coach: "Which part of the setup should I observe, and which available session fits the changed schedule?"

A recovery-related planning decision

Alex could explain the changed demands and difficulty recovering to a trusted adult and coach. The discussion could review the schedule and appropriate support rather than label the problem as weak motivation.

Evidence and a revision

The record shows six completed routines and four rushed setups. Keep recording the setup separately from the result and review the cue after a demonstration.

Adapt to a new constraint

Identify the most important passage, ask for focused feedback at an available time and revise the review point. Preserve the purpose while changing the action to fit the new time and support.

Explain a choice and a limitation

Changing the environment addresses competence and access, not merely effort. The plan cannot guarantee selection or explain every cause of difficulty.

Written review

Review 1: Intrinsic motivation concerns enjoyment or interest in the activity itself. Integrated regulation concerns a purpose that fits broader values and identity. It remains extrinsic. The same person can have both reasons.

Review 2: Use the stated barrier. A clear demonstration can support competence; a respectful partner can support relatedness. Explain what to ask or observe after the change rather than promise immediate motivation.

Review 3: Effort does not remove constraints, unclear instructions or recovery needs. Describe the changed demand, identify support and adapt the action. A realistic revision is part of planning, not proof of weak character.

Review 4: Name the earlier response and the exact change. For example, separate an outcome goal from a process action or replace a global judgment with an observation. Explain why the revision improves the reasoning rather than copy an entire new plan.

Checkpoint explanations

1: A. Direction identifies where effort is aimed. Similar effort can serve different targets; the scenario does not establish a difference in intensity.

2: B. The value-consistent purpose supports integrated regulation. It remains extrinsic and does not require enjoyment of the activity.

3: C. The changes can support the three needs. Their effects still need checking in context rather than being treated as guarantees.

4: D. Preparing a role and offering relevant help are observable actions. They can be connected to contribution without assessing private character.

5: A. The response connects evidence, strategy and feedback. Effort matters, but a learning plan needs more than encouragement alone.

6: B. The statement identifies an action in a specific attempt. It permits repair without making the event a verdict about the whole person.

7: C. The statement recognizes a specific process and progress rather than superiority or entitlement.

8: D. Connecting a claim to an example is an action used in the task. Ratings and selection are outcomes, while a standard is a performance target.

9: A. The information supports a planning and support discussion. It does not establish a diagnosis, treatment or safe workload.

10: B. A person-by-situation explanation considers the task and conditions as well as the learner. One result does not establish a universal prescription.
